

TO SLIP AT WILL IN ANY SEASON

Slippery asphalt type "HZ" for driving improvement tracks and race circuits

Essentially slippery the asphalt* type "HZ", according to the swiss standards VSS, except for the adherence, allows the exploitation of skidpads in road formation and improvement centers and in race circuits, independently of the weather conditions (absence of freezing).

Developed by Jean C. ZUCKER from Company ZUCKER Ltd with Franz HUMMEL, by the way, Organizer of the "24 Heures Automobiles sur Glace de Chamonix Mont-Blanc", and in cooperation with specialized companies and Swiss laboratories, it is simple to lay down and requires only little maintenance. It thus offers an economic and practical alternative to the usual solutions containing resins, paraffin or painting.

Principal advantages of the «HZ»

- **Adherence close to zero:** the special binders using its composition ensure one "slips" at a maximum with standard cars and tyres and not only with adapted vehicles.
- **Simplicity of laying down:** the thin coating is laid down with conventional equipments.
- **Exploitation:** thanks to the permanent use of water, the asphalt preserves all its slippery qualities.
- **Environnement:** Contrary to traditional solutions it does not require any additional application (resin, painting, etc).
- **Economy:** it appears to be more economic in the long term.

First realisation

The **Touring Club Suisse**, the greatest car users Association of Switzerland, has adopted the "HZ" to renew a part of the skidpad of its Road Safety Center of Meyrin-Geneva in early May 2003. Since that time, this first realisation is used with the complete satisfaction of the monitors and the students for the courses of control and skid. The "HZ" also lends itself to the realisation of race circuits (car, motor bike, kart, etc) extending the pleasure of slips in any season and under all the climates.
